                                                                                                                                      composed of a peptide having human granulocyte colony stimulating decror (hot-CEF) activity fused with a peptide having thrombopoietin (TPO) activity, opt. via a spacer peptide. Peptides derived from these by deletion, insertion or substitution of one or more amino acid residues are included within the scope of the invention. The fusion peptides stimulate blood platelet and leukocyte production and are useful in the treatment of anaemia.

                                                                                                                                                                                                         9
         The sequences given in AAT41786-88 encode fusion proteins which are composed of a peptide having human granulocyte colony stimulating factor (hG-CSF) activity fused with a peptide having thrombopietin (TPO) activity, opt. via a spacer peptide. Peptides derived from these by deletion, insertion or substitution of one or more amino acid residues are included within the scope of the invention. The fusion peptides stimulate blood platelet and leukocyte production and are useful in the treatment of anaemia.

Peptides derived from these by deletion, insertion or substitution of one or more amino acid residues are included within the scope of the invention. The fusion peptides stimulate blood platelet and leukocyte production and are useful in the treatment of anaemia.

                        protein. The is a humoral factor capable of promoting platelet production. The encoded protein can be purified by using a gel affinity column where Mpl has been coupled to a resin. AAQ99551 and AAQ99553 also encode TPO proteins. The DNA sequences are inserted into vectors which are used to transform prokaryotic and eukaryotic host cells. Using the proteins encoded by these sequences, and derivatives of them, antibodies specifically immunoreactive with a TPO protein can be created. The antibodies. DNA sequences and vectors are used to isolate the protein sequences. The TPO proteins can then be used in the treatment of platelet disorders. These include thrombocytopenia, hypoplastic anamemia, AIDS, disseminated intravascular coagulation syndrome and
               sequence for a thrombopoietin (TPO)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein that stimulates megakaryopoiesis and thrombocytopoiesis. The cDNA can be incorporated into an expression vector and utilised in the prodn. of low mol.wt. bloactive human thrombopoietin in eukaryotic (partic. yeast or mammalian) host cells. The recombinant thrombopoietin has an N-terminus at Ser-22 and a C-terminus between Arg-185 and Asn-192 (esp. Arg-198 or Phe-207), and is useful for increasing platelet prodn. in the treatment of thrombocytopenia or for increasing proliferation of cells in bone marrow.

                                                                                                                                                                                                                                                                            It was isolated by PCR from human liver and kidney cDNA templates using primers (see also AAT37385-88) derived from exon sequences of a human genomic TPO clone (see also AAT37384) and from the conserved 5' untranslated sequence of mouse TPO cDNA (AAT37382). The cDNA can be used to produce recombinant mature TPO in transformed host cells. Purified, homogeneous TPO is obtd. that is suitable for therapeutic

In a claimed method, thrombopoietin (TPO) (especially human TPO) is administered to a donor to stimulate proliferation of myeloid cells. Bone marrow or peripheral blood stem cells are collected from the donor and administered to the recipient. The method is used for preparing cells for (bone marrow) transplantation and for stimulating

platelet or erythrocyte recovery in a patient receiving chemotherapy or radiation therapy for e.g. breast cancer, leukaemia, lymphoma or multiple myeloma. Treating the donor with TPO accelerates restoration of erythrocyte and thrombocyte levels in the patient after transplant. This restoration may be further improved by administering TPO to the recipient after transplant. The present sequence encodes human TPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300

This cDNA encodes a thrombopoletin (TPO) polypeptide. This can be used in the construction of a new expression vector replicable in a ewkaryotic host cell encoding TPO polypeptides. The vector comprises a transcription promoter, a first DNA segment encoding a secretory leader, a second segment encoding a TPO polypeptide and a transcription cerminator which are all operably linked. The second TPO segment consists of C-X-B, where C is a human TPO cytokine domain, X is a peptide bond or a linker consisting of one or two amino acid residues, such that X along in combination with C or B does not provide a dibasic amino acid pair and B is a polypeptide that can be selected from AAM53126. The secretory leader is a S. cerevisiae alpha-factor secretory leader. A cultured yeast cell containing such an expression vector can be used to produce the TPO polypeptide. The TPO polypeptide can be used to increase for increasing platelet number in a mammal. It can be used to increase those induced by aplastic anaemia, myelodisplastic syndromes, those induced by aplastic anaemia, myelodisplastic syndromes, thrombocytopenia, haematologic disorders, such as leukaemia and lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240

The anaemic mammal to be treated will have shown a heamatocrit level less than 33 percent of total blood volume, a reticulocyte count of less than 0.8 percent and may have been treated with radiation or chemotherapy. The improved red blood cell level is due to an increase in red blood cell production rather than a decrease in red blood cell destruction. TPO protectins may be used therapeutically to increase proliferation of haematopoietic cells in the bone marrow, such as in the treatment of cytopenia or anaemia, especially associated with bone marrow failure, disorders associated with low red blood cell production, particularly when accompanied by thrombocytopenia and for increasing the level of

Various active molecules that may result from truncations of the sequence set forth as MGDF-1 (AAR80824) are given in AAR80822, AAR80823, & AAR80825. AAR80826 is the signal peptide. The preferred truncation variants of MGDF-1 are any of those that have Crterminal truncations from AA 173.353 (along with cleavage of the signal peptide). The signal peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tocagoooggotoottotgtgtgacotocgagtcotoagtaaactgcttogtgactoc 155

Mpl ligand is synonymous with MGDF. Mpl ligands are mammalian megakaryocyte growth promoting and/or platelet producing factors. MGDF-2 is a truncated portion of MGDF-1. It is hypothesised that human MGDF is expressed in vivo as a substantially inactive or less active precursor polypeptide that contains variable C-terminal AAs. Upon cleavage of the C-terminal AAs (as well as the signal peptide), the processed form(s) of the molecule retain activity or become more active. It is believed that MGDF-1 may require processing in order to exhibit its activity. The fact that a truncated form MGDF-1 (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence encodes native human mpl ligand. The invention concerns analogues of mpl ligand which have altered glycosylation patterns. Alteration of glycosylation of mpl ligand can cause improved biological activity. The mutated proteins comprise a greater or lesser number of carbohydrate side chains and higher or lower sialic acid content than wild type mpl ligand. Compositions comprising the mpl ligand analogues of the invention may be used to treat diseases involving an existing or expected megakaryocyte/

(http://www.ngar.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114) (pblART29072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10.Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qilq192114) qbilakhl29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Determination of this BAC-end sequence was carried out as part of a
collaboration with the Berkeley brosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila
melanogaster genome using these BACs. For further information
please see http://www.fruitfiy.org The BDGP Drosophila
melanogaster BAC library was prepared by Kazutoyo Osoegawa and
Aaron Mammoser in Pieter de Jong's laboratory in the Department of
Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,
NY. The library is named RPCI-98 and was constructed by partial
ECORI digestion of Drosophila DNA provided by the BDGP from the
isogenic strain y2; cn bw sp, the same strain used for the BDGP's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note="Organ: mammary; Vector: pCMV-SPORT6; Site_1: Sall; Site_2: Not1; Cloned unidirectionally.                                        Fusion peptide having G-CSF and with thrombopoietin activity - optionally chemically modified with a poly:alkylene glycol, used for
                                                                                                                                                                                                                                                                1 ATGGAGCTGAATTGCTCCTCGTGGTCATGCTTCTCCTAACTGCAAGGCTAACGCTG 60
                                                                                               The sequences given in AAT41786-88 encode fusion proteins which are composed of a peptide having human granulocyte colony stimulating factor (NG-CSF) activity fused with a peptide having thrombopoletin (TPO) activity, opt. via a spacer peptide. Peptides derived from these by deletion, insertion or substitution of one or more amino acid residues are included within the scope of the invention. The fusion peptides stimulate blood platelet and leukocyte production and are useful in the treatment of anaemia.
